

Vitech Connection Manager

The Vitech Connection Manager is a socket listener which enables the devices to communicate to your existing WMS or host system through a growing number of connection options, including Microsoft SQL stored procedures, Oracle stored procedures, or web services. The connection manager receives the procedure or function call from the device and is responsible for executing the command against the data source and returning results to the device. Device communication is standardized on command strings across TCP/IP socket connections to minimize load on your wireless network.

Voice Enabled Processes:

- Put Away
- Replenishment
- Cart Picking
- Order Picking
- Cycle Count/Count Check
- Directed Moves/Consolidations
- Carton Audit
- Loading
- Receiving
- Put To Store
- Pallet Building
